

Professional Tyre changing machines – Latest To Make The Task Simpler!

Make Your Job Easier With Tyre Machines And Wheel Balancers

Tyre machines have proven to be an asset to workshops and garages, as no longer workers have to struggle with changing tyres.

Automobile accessories are associated elements of a vehicle, which help in increasing the efficiency and appearance of a vehicle. The vehicle accessory of top quality beautifies the incomplete and plain area of the vehicle by its charm and attraction.

One such important accessory of any automobile is its wheels. Wheels or tyres guard the performance of a vehicle as well as protect lodgers. Wheels are the key constituents of a vehicle and to guard the rims of a wheel from damaging while changing of tyres, tyre machines is one of the effective means. Earlier, steel rims were more common than any other type of rims but were quite heavy in weight as compared to the alloy wheels, which are quite light in weight.

Nonetheless, steel rims are very easy to repair, where as the alloy wheels are tough to mend but are simple to accelerate. Indeed, steel rims can be re-shaped into its usual shape easily by using a simple hammer where as alloy wheels cannot be brought back into its shape as it generally breaks but with the help of tyre machines all kind of wear and tear of tyre can be taken care of.

Today a large number of tyre machines are available that are ideal for both small workshops as well as garages, which helps in changing and maintaining the tyres of the vehicles. By using these tyre machines, it becomes very easy to demount and mount the tyres.

The tyre changing machines operate both on the lower and upper bead that tenderly removes the tyre or rim from the wheel and lessen stress as well as damage. The tyre machines are easily obtainable in the market and that at also at very affordable rates. These high performance tyre changers are an excellent substitute obtainable for mounting and demounting of the vehicles tyres.

These machines have the aptitude to grip a tyre of any size. Remote control unit, lubricated unit fitted, air powered bead breaking system and two pneumatic cylinders are some of key features of these tyre machines.

Complete with an extraordinary mounting tool and polyurethane tool as well as the standard steel mounting head, the tyre machines provides an integrated security for the alloy rims. Additionally, the mounted spoke tool along with its extraordinary surface treatment has the ability to change any wheel, reduces the friction on the tyre and also has features of rotation and angle adjustment.

With the help of tyre machines, the most tough wheels and tyres can be de-mounted and mounted in an easy and safe way. The incorporated central locking system laser guides the lower and upper bead breaker and the computer-regulated rotation speeds up the functioning of the tyre machines.

The fully mechanical tyre machines and wheel balancers also feature LCD display and are semi-automatic and swing arm machine, which are capable to mount the tyres up to 24 inches rim. The tyre machines also includes a wheel balancer with an automatic distance data input and rim diameter, which is fully proficient and motorised to grip 24 inches rims with the hidden and special weight functions along with guided programs relating to weight placement.
